

EXPERIMENT 1(a): To develop a website and host it on your local machine on a VM

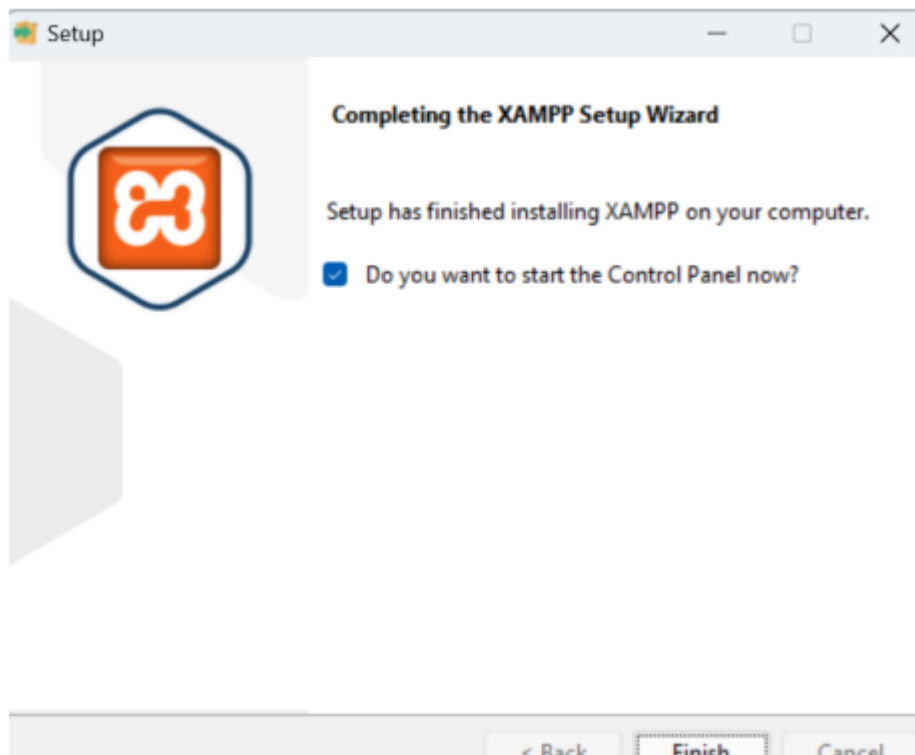

STEP 1: Installing Xampp on your local machine by going on google website and downloading it.

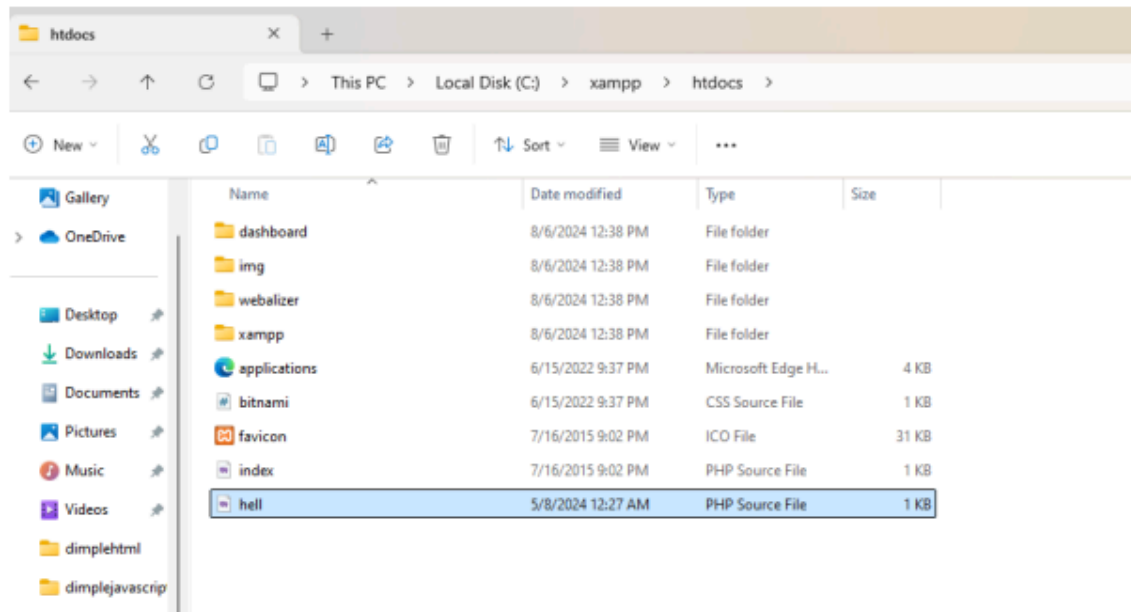

STEP 2: Setting the environment by selecting components and clicking next button.

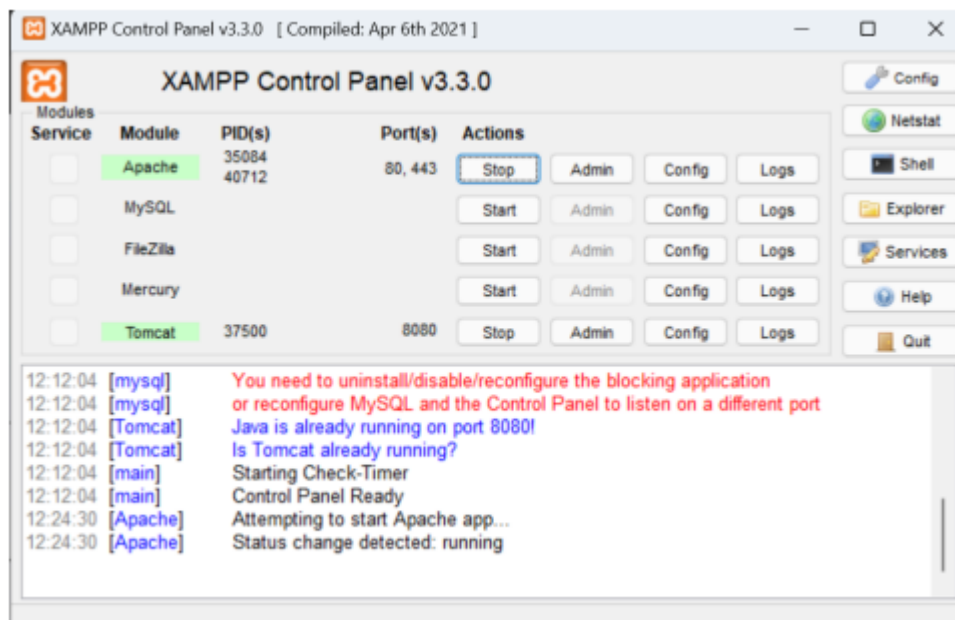

STEP 3: Completing the steps for setting environment for xampp by clicking on finish button.

STEP 4: Making a php file by the name hell and copying the file from the desktop and pasting it inside the folder where xampp is downloaded.

STEP 5: Starting the Apache module and Tomcat module from the Xampp control panel.

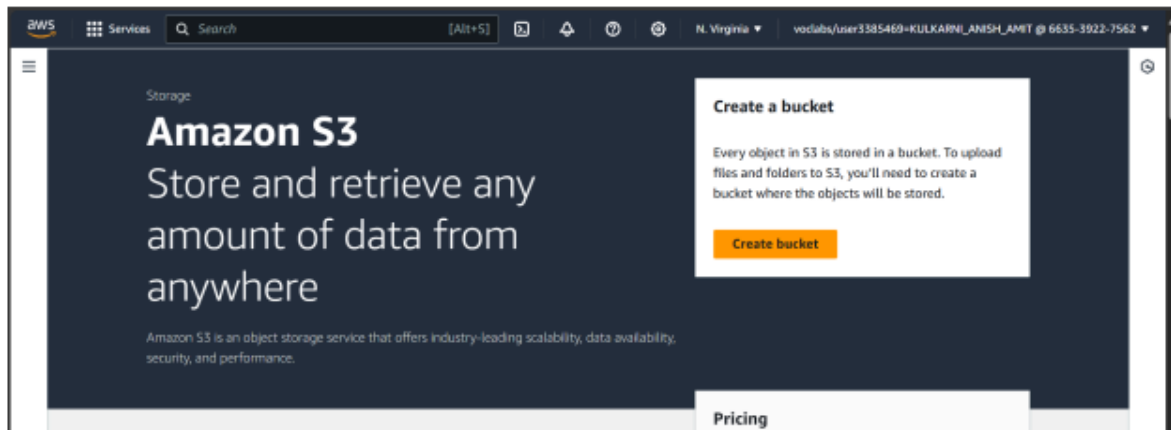

STEP 6: Hosting the website on Xampp.

Hosting a static website on Amazon S3

STEP 1: Creating a bucket by searching S3 on the AWS account and clicking on create a bucket button.

STEP 2: For creating the bucket click on general purpose and enter bucket name.

AWS Region
US East (N. Virginia) us-east-1

Bucket type [Info](#)

☒ **General purpose**
Recommended for most use cases and access patterns. General purpose buckets are the original S3 bucket type. They allow a mix of storage classes that redundantly store objects across multiple Availability Zones.

☐ **Directory - New**
Recommended for low-latency use cases. These buckets use only the S3 Express One Zone storage class, which provides faster processing of data within a single Availability Zone.

Bucket name [Info](#)

Bucket name must be unique within the global namespace and follow the bucket naming rules. [See rules for bucket naming](#)

Copy settings from existing bucket - *optional*
Only the bucket settings in the following configuration are copied.

Format: s3://bucket/prefix

STEP 3: Enable the static website hosting and selecting hosting type as host a static website. bucket button.
